

## **Suggestions for Avian Submissions**

### **For The Diagnosis of a Disease Problem Within A Flock:**

Submit 4 to 5 freshly dead birds that have died of the condition, preferably refrigerated and kept cool until they arrive at the laboratory. Time is important as small carcasses decompose quickly.

Submit 4 to 5 live, sick birds that are clinically affected with the condition. Take care not to select cull birds from the flock which do not represent the disease condition. These specimens should be shipped by express in containers suitable for live birds.
